Wyoming State Epidemiological Outcomes Workgroup: 2012 State Epidemiological Profile

1. Introduction
This report presents the Wyoming State Epidemiological Outcomes Workgroup (SEOW) with findings from a comprehensive data review completed by the SEOW and Wyoming Survey & Analysis Center (WYSAC). It includes data on alcohol, tobacco, illicit drug use, prescription drug abuse, mental health, and general related factors. For each substance, data are organized into three groups, consequences, consumption or prevalence, and substance-specific risk and protective factors.

1.1. Purpose of the SEOW
The SEOW is a program of the Wyoming Department of Health (WDH) directed by the WDH Public Health Division (PHD). It is comprised of representatives from:

- WDH,
- Wyoming Department of Education,
- Wyoming Division of Criminal Investigation,
- Department of Family Services,
- Board of Pharmacy,
- Tribal services from the Arapaho and Shoshoni Tribes,
- Community prevention providers and,
- Researchers from the University of Wyoming, WYSAC.

The SEOW’s charter is to provide guidance and information regarding the available data associated with substance abuse and mental health issues throughout the state. In particular, the SEOW is responsible for gathering, reporting, and disseminating information regarding substance abuse and mental health data in Wyoming. It also serves as a decision-making body regarding the deliverables for the SEOW grant. The SEOW helps determine directions to pursue, review results, and make recommendations.

Its support comes from the WDH and a grant from the Federal Substance Abuse and Mental Health Services Administration (SAMHSA).

1.2. Deliverables
As part of its funding, the SEOW is charged with developing state and community epidemiological profiles of key substance use and mental health indicators. WDH contracts with WYSAC to complete these deliverables.

This report constitutes the state profile. Its primary purpose is to serve as a reference document for the SEOW itself to understand the available data at the state level regarding alcohol, tobacco, illicit drugs, prescription drugs, and mental health issues. Later, we will reuse the data from this report to create more accessible documents to inform policy makers, legislators, and the public of the available state-level information about mental health and substance abuse prevention.

The SEOW will use data in future deliverables.
1.3. Procedures

During SEOW meetings in early 2011, the SEOW chose to focus on six areas: alcohol, tobacco, and illicit drug use, prescription drug abuse, mental health, and general related factors. The SEOW then decided to subdivide variables in each of these areas into three categories: consequences, consumption and/or prevalence, and risk and protective factors.

The SEOW appointed a subcommittee to assign priority scores to each potential variable. The subcommittee developed consensus priority scores for each potential variable ranging from one to four, with one being the highest priority, and four the lowest. A score of one reflects great importance of the concept, strong accord between the concept and the indicator, and high data reliability and availability. A score of four, in contrast, reflects relatively low importance of the concept, weak accord between the concept and the indicator, and low data reliability and availability. Based on a decision of the subcommittee, only those indicators that have a priority one or two were included in the state and community profiles.

During the process of reviewing the state and community profiles, the SEOW explicitly decided to forego all conclusions and interpretations of the results at this time. The SEOW felt that such data interpretation is best completed when the data is used outside of this reference document, such as in the creation of Fact Sheets and Information Briefs that are tailored to particular audiences. As a result, the notable findings section and the report purposely omit any data interpretations.

1.4. Presentation Conventions

During SEOW meetings in April and June 2011, the Workgroup reviewed early drafts of the state and community profiles and offered guidance on data presentation. Data presentation conventions include:

- A graphic in the upper outside corner of each page indicates whether the variable on that page is a consequence (in which case the upper cell is shaded), consumption or prevalence (middle cell shaded), or risk or protective factor (lower cell shaded).
- Wherever possible, both national and Wyoming data are presented. Unless otherwise specified, all data pertain to Wyoming.
- Data are presented in graphs with data tables.
- In general, time series data are presented in line graphs. If only one or two years of data are available, data are presented in bar graphs.
- When data are presented by race/ethnicity or by school grades, bar graphs are used.
- For data collected at regular intervals, generally every year or every alternate year, associated line graphs are continuous. If, however, data are available only for irregular or inconsistent intervals, interruptions in the regular pattern are represented by un-adjoined points on graphs.
- Where available, confidence intervals appear in the data tables below the graphs.
- Scales used on all graphs are as consistent as possible. For variables represented as percentages, three vertical axis scales are used whenever possible, 0 to 100%, 0 to 50%, and 0 to 10%.
- When necessary, a vertical dotted line is inserted into the graph to indicate the point in time which a change in methodology has occurred that necessitates cautious interpretation of the trend.
2. Notable Findings

The State Epidemiological Outcomes Workgroup (SEOW) examines the distribution of social issues (e.g., substance abuse and mental health) in the state of Wyoming through the use of several data sources. Specifically, the SEOW investigates the consumption patterns, consequences, and risk/protective factors associated with selected social issues. Each year, the SEOW releases a summary report of findings at the state level. The bullet points that follow are notable findings across the multiple data sources and topic areas covered in this summary.

**Alcohol Related Consequences**

- Despite slight declines since 2008, during 2011, the overall DUI arrest rate in Wyoming was approximately double the national average (869 vs. 390, respectively) (see page 8, chart 6).
- Although arrest rates for liquor law violations have been declining since 2008, during 2011, Wyoming’s arrest rate was still approximately 4.5 times higher than the national average (566 vs. 123, respectively) (see page 6, chart 4).
- From 2001 to 2011, compared to the national average, Wyoming youth were approximately 5 times more likely to be arrested for liquor law violations (508 vs. 94) (see page 7, chart 5).
- From 1995 to 2011, the percentage of high school students who reported drinking and driving has declined to 12% (from 22% in 1995) (see page 12, chart 10).
- Since 1995, there has been a pronounced decline in the percentage of high school students who reported riding in a car with someone who had been drinking (26% in 2011 vs. 42% in 1995) (see page 14, chart 12).

**Alcohol Consumption**

- Since 1995, self-reported past 30-day alcohol use among high school students declined (52% vs. 36% in 2011, respectively) (see page 26, chart 26).
- Since 2003, compared to women, men in Wyoming have consistently reported higher rates of binge drinking. In 2011, men were more than 2.5 times as likely as women to report binge drinking in the past month (27% vs. 11%) (see page 20, chart 18).

**Tobacco**

- Compared to 2001 levels, in 2012, fewer 10th and 12th graders reported using cigarettes in the past 30 days (18% vs. 26%, respectively) (see page 56, chart 68).
- During 2010, nearly one-sixth of women in Wyoming (15%) reported smoking during the last trimester of their pregnancy, while approximately one-third (30%) reported smoking during the three months prior to their pregnancies (PRAMS) (see page 50, chart 62).
- Since 2002, support for smoke-free restaurants has slowly increased. As of 2010, the majority of adults in Wyoming (73%) reported they support smoke-free restaurants (see page 66, chart 83).
- In 2012, compared to 6th graders, 8th graders were nearly twice as likely to think that the majority of their peers smoked during the past month (31% vs. 59%, respectively) (see page 64, chart 80).
- In 2012, compared to 6th graders and 8th graders, 10th and 12th graders were nearly twice as likely to report thinking that most of their peers chewed tobacco in the past month (37% vs. 78%, respectively) (see page 62, chart 76).
- In 2012, compared to their White and Hispanic counterparts, Black and American Indian high school students were more likely to report having smoked cigarettes in the past 30 days (11% and 14% vs. 19% and 19%, respectively) (see page 58, chart 73).
Illicit Drugs

- Since 2001, Wyoming has consistently exceeded the national average for total drug abuse violations, with 568 arrests per 100,000 in 2010 compared to 377 per 100,000 nationally in 2011 (see page 74, chart 91).

- When compared to the national arrest rate, youth in Wyoming are approximately 3.5 times more likely to be arrested for a drug abuse violation (565 vs. 153 respectively) (see page 74, chart 92).

- In 2012, one seventh (14%) of 10th and 12th grade students reported using marijuana in the past 30 days (see page 76, chart 95).

- In 2012, compared to 6th graders and 8th graders, 10th and 12th graders were nearly twice as likely to report thinking that most of their peers used marijuana during the past month (39% vs. 72%, respectively) (see page 89, chart 111).

- Despite a steady decline since 1997, during 2009 and 2011, a slightly increased number of students indicated using marijuana in the past 30 days (see page 77, chart 96).

- In 2012, White students (8%) were less likely to report use of marijuana during the past 30 days compared to their minority counterparts (13% for Hispanics, 20% for Blacks, 22% for Native Americans, and 12% for other racial groups) (see page 79, chart 99).

Licit Drugs

- In 2012, based on the available data, the most commonly observed diagnostic category in prescription drug-related overdoses was psychotropic agents (see page 94, chart 117).

- In 2012, over-the-counter and prescription drug abuse was reported more frequently among 10th and 12th grade students (4%) than 6th and 8th grade students (1%) (see page 100, chart 123).

Mental Health

- Since 2000, the suicide rate in Wyoming has been nearly two times higher than the national average (21 vs. 12 in 2009) (see page 107, chart 130).

- In 2011, approximately 1 out of 10 adults reported experiencing frequent mental distress over the past 30 days (see page 110, chart 135).

- In 2010, approximately 1 out of 10 high school students reported attempting suicide in the past year (see page 114, chart 139).

- In 2012, approximately one in five 8th graders reported having seriously considered attempting suicide (see page 116, chart 142).

General Related Factors

- Since 2001, compared to 6th and 8th graders, 10th and 12th graders were twice as likely to be considered high-risk for drug and alcohol use because their parents have favorable attitudes toward drug use (22% vs. 49% in 2012, respectively) (see page 120, chart 141).

- In 2012, compared to 6th and 8th graders, 10th and 12th graders were more likely to have a favorable attitude towards drug use (18% and 31%, respectively) (see page 126, chart 150).

- In 2012, one in four 6th graders classified as high risk because of their answers to a scale that measures the student's perceptions of how easy it would be for them to obtain alcohol, cigarettes, marijuana, and other illegal drugs (see page 128, chart 153).

WVS 2011
“Alcohol use creates a paradox more than the use of any other substance, legal or not. It is used all over the world more than any other substance and probably more safely; yet, it can also be a powerful and hazardous drug. Only tobacco use causes more morbidity and mortality” (Compton, 2010, p. 164).
Drunkenness Arrests

Data Source:
BRFSS 2003–2011

Note: The BRFSS experienced a changing in weighting methodology in 2011. Therefore, 2011 data should not be compared to data from previous years.
Based on controlled research of community-level interventions, the following five components reduced alcohol-involved crashes, lowered sales to minors, increased the responsible alcohol serving practices of bars and restaurants, and increased community support and awareness of alcohol problems:

- Community mobilization, organization, and support
- Standards of responsible beverage service at alcohol outlets to reduce the number of intoxicated customers
- Increasing the perceived and actual probability of law enforcement identifying intoxicated drivers
- Reduction of retail alcohol availability to minors
- Reducing retail availability of alcohol through zoning and other municipal controls

(Holder, 2000).
Binge Drinking by Age Groups

Tobacco-Related Mortality by Cause of Death

Chart 59: Wyoming Age Adjusted Death Rate—Lung Cancer, Cerebrovascular Diseases (Stroke), and Chronic Obstructive Pulmonary Disease (COPD)

Definition:
Wyoming deaths per 100,000 population from lung cancer, cerebrovascular diseases (stroke), and chronic obstructive pulmonary disease (COPD), age adjusted.

Data Source:
WVS 2008

Note: Although smokers are at an elevated risk for developing these diseases, smoking is not the only cause of these diseases. Therefore, these estimates should be interpreted with due caution.

“Smoking results in more deaths each year in the United States than acquired immunodeficiency syndrome [AIDS]; alcohol, cocaine, and heroin use; homicide; suicide; motor vehicle crashes; and fires, combined (U.S. Department of Health and Human Services 2000)” (Compton, 2010).
TOBACCO CONSEQUENCES

Chart 60: Self-Reported Incidence of Stroke

Definition:
The percentage of Wyoming adults reporting having had a stroke.

Data Source:
BRFSS 2005–2011

Chart 61: Self-Reported Incidence of Heart Disease

Definition:
The percentage of Wyoming adults reporting coronary heart disease, angina, or a heart attack.

Data Source:
BRFSS 2005–2011

Note: The BRFSS experienced a changing in weighting methodology in 2011. Therefore, 2011 data should not be compared to data from previous years. Although smokers are at an elevated risk for developing a stroke, smoking is not the only cause of strokes. Therefore, these estimates should be interpreted with caution.
## Smoking Before and During Pregnancy

### Chart 62: Maternal Smoking Prevalence—Three Months Prior to Pregnancy and During the Last Trimester

**Definition:**
Maternal smoking three months prior to pregnancy and during the last trimester.

Non-fatal and Fatal Prescription Drug-Related Overdoses

Total Poisonings

Chart 115: Wyoming Prescription Drug-Related Poisonings (By Diagnosis Type)

Definition:
Rate per 10,000 Hospital Discharges for prescription drug-related poisonings in Wyoming. Poisonings are defined as an “overdose of... substances and wrong substance[s] given or taken in error” (ICD-9-CM, 2006). Primary diagnoses are the most resource intensive condition a patient presents when admitted (e.g., heart attack) while secondary diagnoses refer to factors that may or may not have contributed to the primary diagnosis, but are present nonetheless (e.g., drug use).

Data Source: Wyoming Hospital Association, 2009-2012

"Although most people take prescription medication responsibly, an estimated 52 million people (20 percent of those aged 12 and older) have used prescription drugs for nonmedical reasons at least once in their lifetimes" (National Institute on Drug Abuse, 2011, p.1).
**Chart 116: Wyoming Prescription Drug-Related Accidental Poisonings**

**Definition:**
Rate per 10,000 Hospital Discharges for prescription drug-related accidental poisonings in Wyoming. *Accidental* poisonings are those classified as having an *external cause* and are considered supplemental to regular poisonings.

**Data Source:** Wyoming Hospital Association, 2009-2012

---

**Note.** *The International Classification of Diseases, 9th edition* (ICD-9), is a coding manual used by health professionals to classify medical conditions for billing purposes. The ICD-9 allows health professionals to record supplementary information about a diagnosis called "E-codes" to identify external causes that are additional to an initial injury diagnosis. For this reason, all accidental poisonings are classified as secondary diagnoses, as this diagnosis is supplementary.

**Accidental poisonings should be treated as a sub-set of poisonings and not as separate incidents.**
Non-fatal and Fatal Prescription Drug-Related Overdoses

Poisonings by Drug Type

Note. Provided rates are crude. Where possible, to aid with visual presentation, selected diagnostic categories have been combined. Accidental poisonings are excluded from presented estimates (see page 97).

Please refer to page 98 for a complete list of the ICD-9 codes used.

Chart 117: Wyoming Prescription Drug-Related Poisonings (Drug Type)

Definition: Rate per 10,000 Hospital Discharges for prescription drug-related poisonings in Wyoming, organized by drug type. Poisonings are defined as an “overdose of... substances and wrong substance[s] given or taken in error” (ICD-9-CM, 2006). Primary diagnoses are the most resource intensive condition a patient presents when admitted (e.g., heart attack) while secondary diagnoses refer to factors that may or may not have contributed to the primary diagnosis, but are present nonetheless (e.g., drug use).

Data Source: Wyoming Hospital Association, 2009-2012

Note. The International Classification of Diseases, 9th edition (ICD-9), is a coding manual used by health professionals to classify medical conditions for billing purposes. The ICD-9 allows health professionals to record supplementary information about a diagnosis called "E-codes" to identify external causes that are additional to an initial injury diagnosis. For this reason, all accidental poisonings are classified as secondary diagnoses, as this diagnosis is supplementary.

**Accidental poisonings should be treated as a sub-set of poisonings and not as separate incidents.**
### Table 3. List of Prescription Drug-Related Overdose ICD-9 Codes.

**Definition:** The ICD-9 is a diagnostic codebook used to classify medical diseases and symptomology. Table 2 provides a complete listing of the ICD-9 diagnostic codes included in the presented charts for prescription-drug related overdoses (see pages 94-97). Codes 960-969 refer to poisonings, while "E" codes refer to accidental poisonings. Because heroin and hallucinogens are classified as Schedule I Substances (i.e., they do not have an accepted medical use), these substances were intentionally excluded.

Emotional Support

Adults

Chart 140: Limited Emotional Support

**Definition:**
The percentage of Wyoming adults who reported that they rarely or never get the social or emotional support they need.

**Data Source:**
BRFSS 2005–2010

Chart 141: Agree that People Are Caring and Sympathetic Toward People With Mental Illness

**Definition:**
The percentage of Wyoming adults who reported either slightly or strongly agreeing with the statement that people are generally caring and sympathetic to people with mental illness.

**Data Source:**
BRFSS 2007, 2009
Based on interviews with the close relatives and medical care providers of those who die by suicide, depression is the most frequent psychological disorder likely to be associated with suicide. This is also valid when a depressive episode co-occurs with personality disorders, schizophrenia, and substance use disorders. Co-occurring psychological disorders also increase the risk of suicide (Mann & Currier, 2007).

**Chart 150: Favorable Attitude Toward Drug Use—Wyoming Student High-Risk Rate (Grades 6 and 8, and 10 and 12)**

**Definition:**
The percentage of Wyoming students classified as high risk because of their answers to a scale that measures the student’s approval of someone his/her age using alcohol, cigarettes, marijuana and other illegal drugs.

**Data Source:**
PNA 2001–2012
Chart 151: Favorable Attitude Toward Drug Use—Wyoming Student High-Risk Rate (Females and Males)

Definition:
The percentage of Wyoming students classified as high risk because of their answers to a scale that measures the student’s approval of someone his/her age using alcohol, cigarettes, marijuana and other illegal drugs.

Data Source:
PNA 2001–2012

Chart 152: Favorable Attitude Toward Drug Use—Wyoming Student High-Risk Rate (Race/Ethnicity)

Definition:
The percentage of Wyoming students classified as high risk because of their answers to a scale that measures the student’s approval of someone his/her age using alcohol, cigarettes, marijuana and other illegal drugs.

Data Source:
PNA 2001–2012
Perceived Availability of Drugs
Youth by Grade

Chart 153: Perceived Availability of Drugs—Wyoming Student High-Risk Rate (6th Grade)

Definition:
The percentage of Wyoming students classified as high risk because of their answers to a scale that measures the student’s perception of how easy it would be for the student to obtain alcohol, cigarettes, marijuana and other illegal drugs.

Data Source:
PNA 2001–2012

"Because prescription drugs are legal, they are easily accessible, often from a home medicine cabinet” (ONDCP, 2010, p. 1).
Chart 154: Perceived Availability of Drugs—Wyoming Student High-Risk Rate (6th Grade, Females and Males)

**Definition:**
The percentage of Wyoming students classified as high risk because of their answers to a scale that measures the student’s perception of how easy it would be for the student to obtain alcohol, cigarettes, marijuana and other illegal drugs.

**Data Source:**
PNA 2001–2012

Chart 155: Perceived Availability of Drugs—Wyoming Student High-Risk Rate (6th Grade, Race/Ethnicity)

**Definition:**
The percentage of Wyoming students classified as high risk because of their answers to a scale that measures the student’s perception of how easy it would be for the student to obtain alcohol, cigarettes, marijuana and other illegal drugs.

**Data Source:**
PNA 2001–2012
Chart 156: Sensation Seeking—Wyoming Student High-Risk Rate (Grades 6 and 8, and 10 and 12)

Definition:
The percentage of Wyoming students classified as high risk because of their answers to a scale that measures how often the student says that he/she participates in dangerous activities regardless of the consequences.

Data Source:
PNA 2001–2012
Sensation Seeking
Youth by Gender & Race/Ethnicity

Chart 157: Sensation Seeking—Wyoming Student High-Risk Rate (Females and Males)
