

CHLAMYDIA IN WYOMING

2019

Chlamydia is a sexually transmitted bacterial infection. Approximately 75% of females and 50% of males infected with chlamydia show no symptoms. If symptoms do occur, they present within one to three weeks after exposure.

Symptoms may include abnormal discharge from the infected site, burning during urination, itching, and pain during intercourse. If left untreated, chlamydia can cause pelvic inflammatory disease (PID). Symptoms of PID can include abdominal pain, fever, and chronic pelvic pain. PID can damage the fallopian tubes and cause infertility. Individuals infected with chlamydia are at greater risk for HIV infection.
