Note 1: Due to changes in accuracy of reporting, specific drug percentages should not be compared to anything after 2016. For example, even though there is an increase in prescription drug use from 2016 to 2017 this increase is inflated by the decrease in unspecified drugs over the same time period. Most of the cases often classified as 'unspecified' are now included in the 'prescription' classification due to improved accuracy in cause of death reporting.

Note 2: The unspecified drug cases in these two years were based on fact of death information shared by another state about a Wyoming resident, detailed information was not provided.
