

LOGIN TO DOCKET® USING FACE ID, TOUCH ID, AND ANDROID BIOMETRICS

NOTE: Docket® does *not* store biometric data. This feature is offered as an optional security enhancement.

How does it work?

You may activate biometric login (i.e. "Face ID," "Touch ID") during sign-up for added security protections. If activated, Docket® uses your biometric signature to authenticate you each time you open the app.

How do I turn it on/off?

You can toggle this capability on or off under the Settings & Info section of the main menu.

Backup Passcode

If your phone cannot read your biometric signature, Docket® will ask for your passcode as a backup authentication method beginning with version 2.2.34.

Data Privacy

Biometric login uses your phone's standard functionality to authenticate you. Docket® does not store any of the results from the verification process, including your phone's passcode.
