

MMWR Week 11 (3/15/2026-3/21/2026)

# INFECTIOUS DISEASE EPIDEMIOLOGY

## Influenza Report

2025 - 2026 Influenza Season

MMWR Week 11 (3/15/26-3/21/26)

*Updated March 27, 2026*

# Overview (MMWR Week 11)

## Influenza and Influenza-like Illness (ILI) Activity

<b>Spread</b> <b>Regional</b> Transmission levels decreased slightly compared to last week	<b>Flu Activity</b> <b>Low</b> Reported influenza case counts decreased compared to last week	<b>ILI Activity</b> <b>Low</b> Reports of outpatient respiratory illnesses increased compared to last week
<b>Co-circulating</b> <b>Other Respiratory Infections:</b> SARS-CoV-2, Pertussis, and increasing levels of RSV	<b>Seasonal Data</b> <b>Types of Flu:</b> Influenza A and B viruses are circulating; flu B percentages are increasing	<b>Subtypes</b> <b>Primary:</b> <b>A H3N2 &amp; B</b> Predominantly, A/H3N2 and B viruses were reported across the country this week
<b>Outbreaks</b> <b>0</b> No LTCF or school-associated influenza outbreaks were reported this week	<b>Severity</b> <b>Hospitalizations</b> The weekly influenza-associated hospitalization rate peaked in week 52 and has since decreased	<b>Deaths</b> <b>123</b> There have been 123 pediatric deaths reported across the country so far this season
<b>Syndromic</b> <b>3</b> There were three syndromic anomalies reported this week in Natrona County	<b>EMS Reports</b> <b>17</b> The number of suspected ILI reports decreased compared to last week	<b>Hot Spots</b> <b>Tracking Trends</b> Several counties reported a decrease in case counts compared to last week

# Geographic Spread

## Geographic Activity by Regions

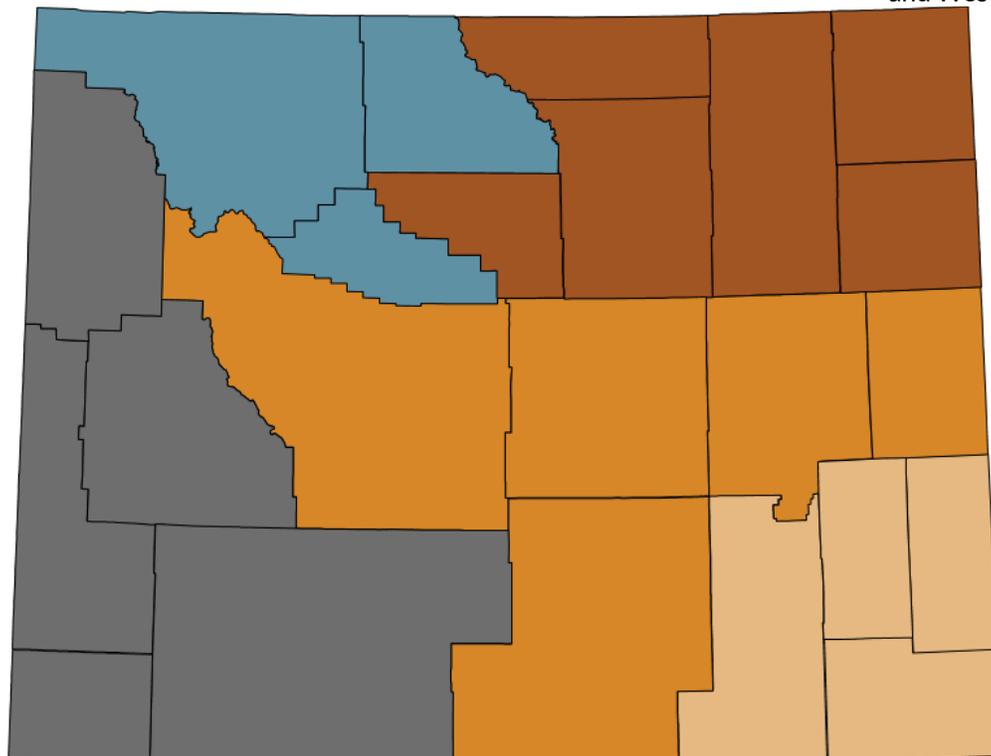

Wyoming as a whole had **low ILI activity** this week (MMWR Week 11).

Transmission levels decreased compared to last week.

- Healthcare providers in **17** counties electronically reported influenza cases.
- The electronically reported influenza cases represent **all five** Infectious Disease Epidemiology (IDE) Geographic Regions.
- Healthcare providers across the state electronically reported **122** influenza cases (rapid influenza diagnostic tests and PCR-confirmed tests) this week.

## IDE Geographic Regions of Wyoming

Southeast	Central	Western	Big Horn	North East
Regional, cases reported in Albany, Laramie, and Goshen	Regional, cases reported in Carbon, Fremont, and Natrona	Regional, cases reported in Teton, Uinta, Lincoln, and Sweetwater	Regional, cases reported in Park and Hot Springs	Regional, cases reported in Campbell, Crook, Sheridan, Johnson, and Weston

# Virologic Surveillance

## Public Health Laboratory

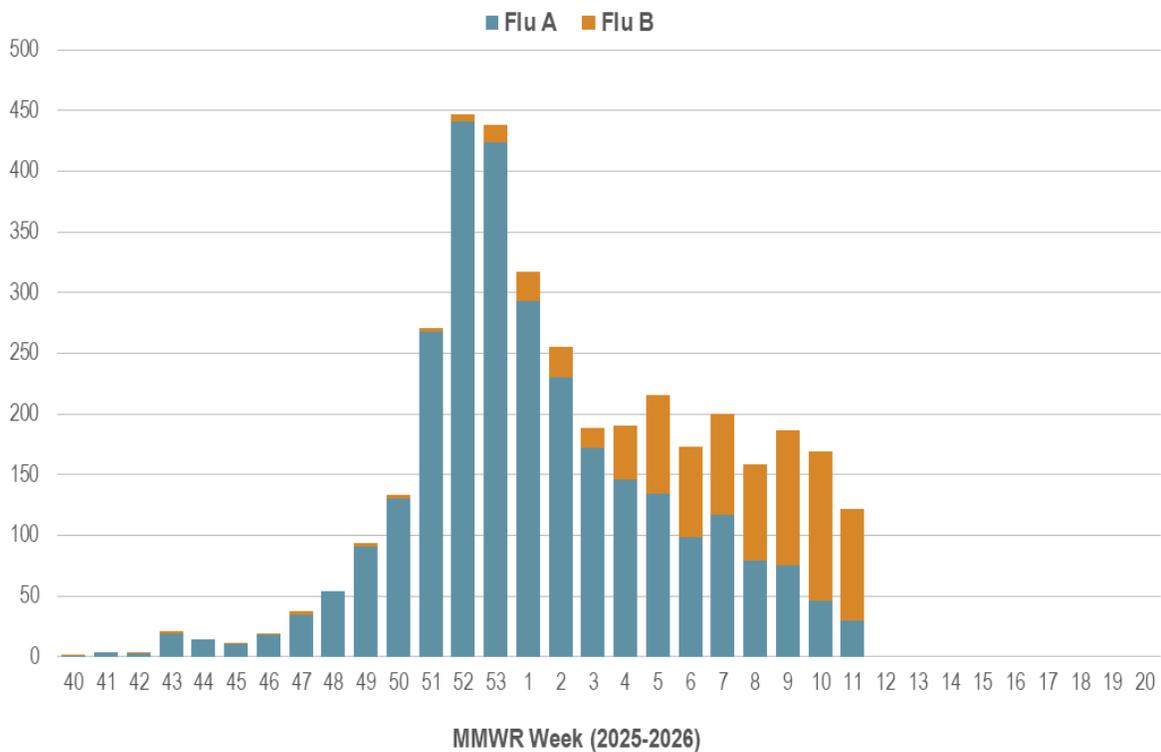

The overall volume of samples tested for influenza at the Wyoming Public Health Laboratory has steadily declined following the increasing distribution of the CDC Influenza SARS-CoV-2 Multiplex Assay, in addition to at-home testing options. We greatly encourage providers across the state to send additional specimens to the WPHL for virologic surveillance. The number of positive influenza specimens electronically reported this week **decreased** compared to the previous week.

## Healthcare and Clinical Laboratories

Clinical laboratories across the country most frequently reported both **influenza A/H3N2 viruses** and **influenza B viruses** circulating during MMWR Week 11.

## Electronic Lab Reports of Influenza Cases

Number of Electronic Lab Reported Cases

# Influenza-Like Illness Surveillance

## MMWR Week 11: 3.75% ▼ below WY baseline (5.36%)

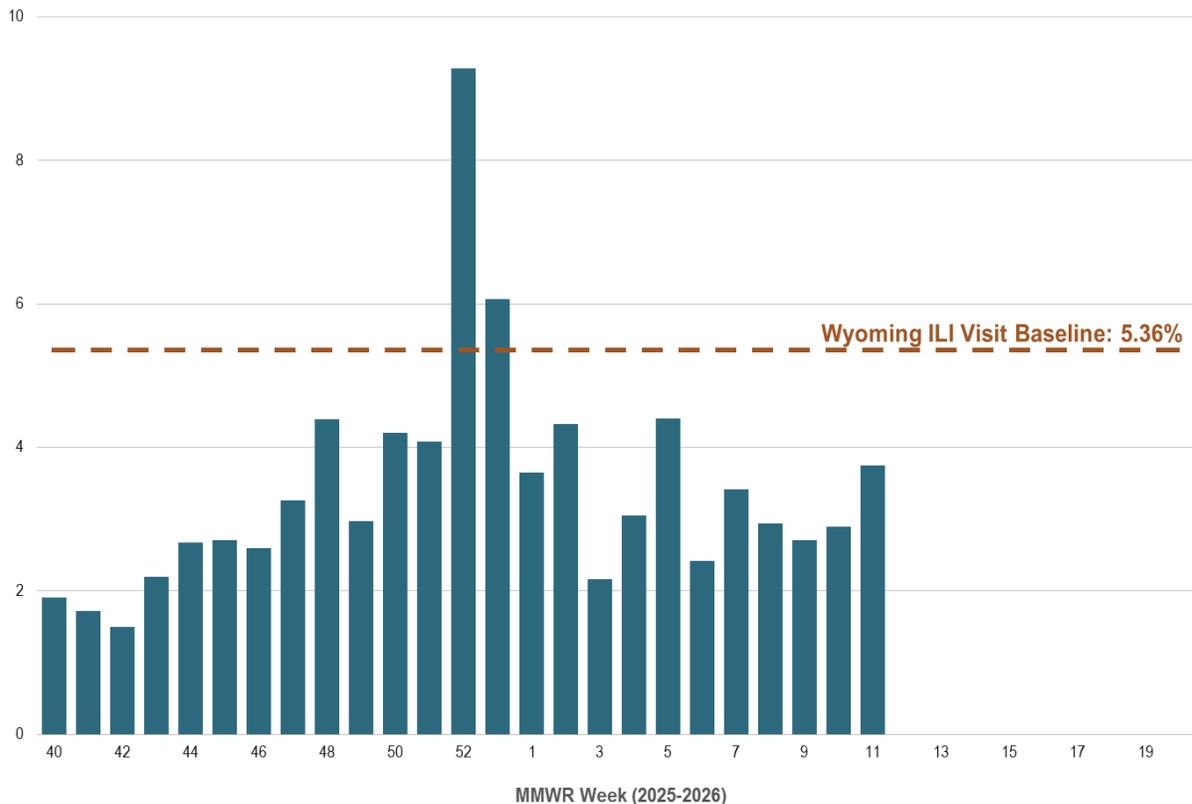

The percent of patient visits to ILI-Net Sentinel Providers for ILI increased compared to last week.

The Wyoming Department of Health received reports from **more than 50%** of the ILINet providers across the state. Although weekly percentages could change as additional reports are submitted.

**Key Updates:** Seasonal influenza activity continues to decrease in most areas of the country. Influenza A activity continues to decrease across all HHS regions, while trends in influenza B activity vary by region. Based on CDC calculations, transmission within Wyoming was **low** this week. Nationally, the percentage of respiratory specimens testing positive for the influenza virus in clinical laboratories decreased this week. The percentage of specimens testing positive for influenza increased in regions 1, 8, and 10, driven by increases in influenza B activity, and decreased in regions 2, 3, 4, 5, 6, 7, and 9.

## Weekly Percent of ILI Visits

Percent of Influenza-like Illness (ILI)

# Pneumonia and Influenza Mortality

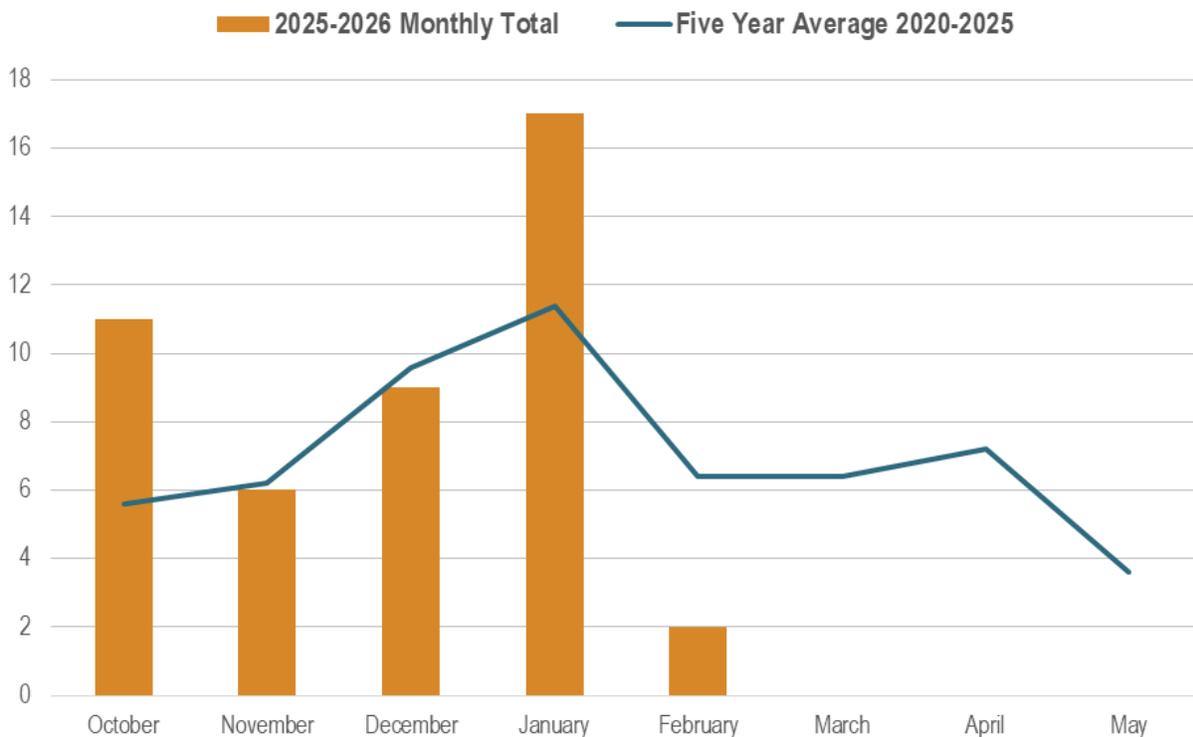

## Mortality Data

Tracking death certificates is the most effective surveillance system for capturing and identifying pneumonia and influenza-associated deaths in Wyoming. According to the CDC, influenza is infrequently listed on death certificates. Also, testing for seasonal influenza infections is not frequently performed, particularly among the elderly, who are at greatest risk for seasonal influenza complications and death. Therefore, public health officials may not be able to identify influenza-associated deaths in many instances; as a result, this surveillance system may underestimate the true impact of influenza-associated deaths in the state.

There have been **45** pneumonia and influenza (P&I) mortality reports certified since the beginning of the 2025-2026 Influenza Season.

## Monthly P&I Mortality Reports (2020-2026)

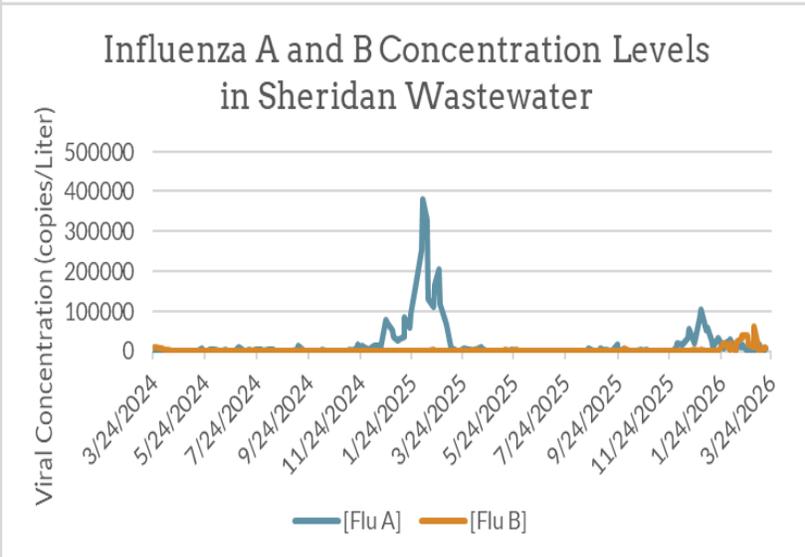

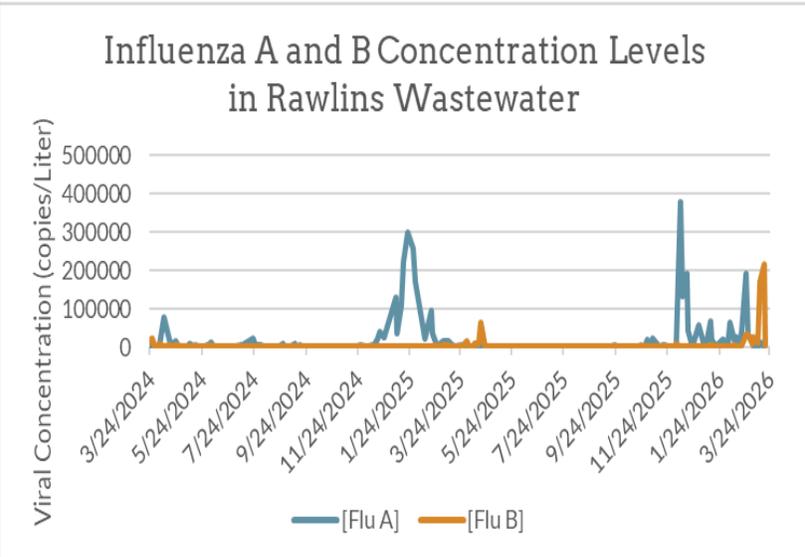

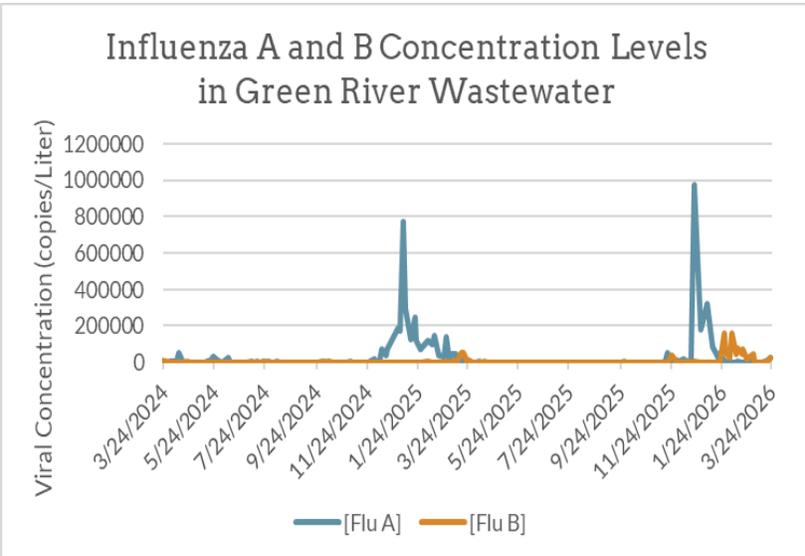

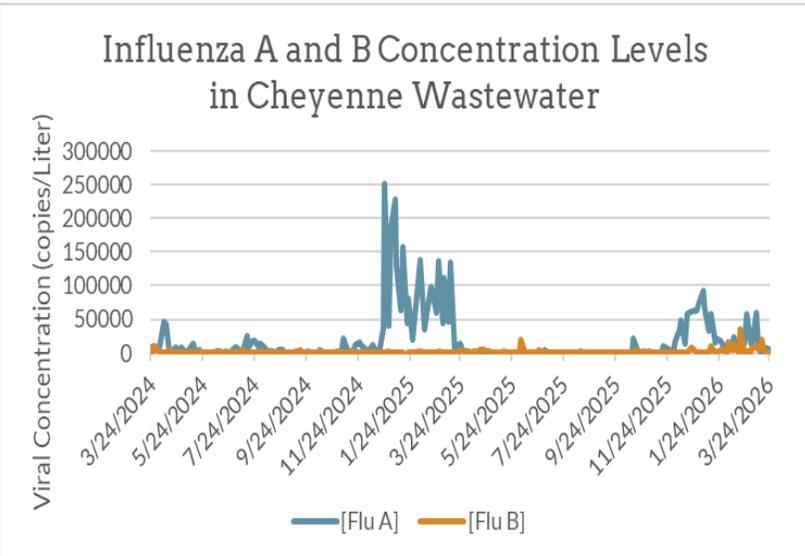

Number of P&I Deaths

# Wastewater Surveillance

Here at the Wyoming Public Health Laboratory (WPHL), we have a team of scientists analyzing wastewater samples from across the state to identify trends in influenza (and many other pathogens). The graphs pictured below depict trend lines for the past two influenza seasons (2023-2026) as well as current trends. It is important to note that the high concentrations observed last season have dwarfed many of the previously detected values.

## WPHL Sites: Cheyenne, Green River, Rawlins, and Sheridan

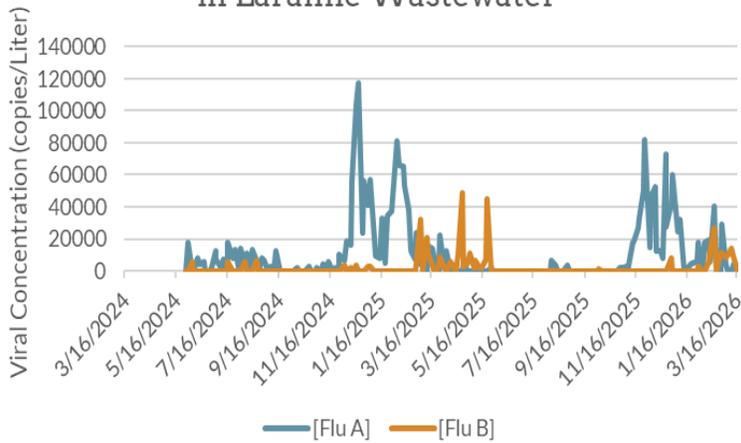

# Wastewater Surveillance Continued

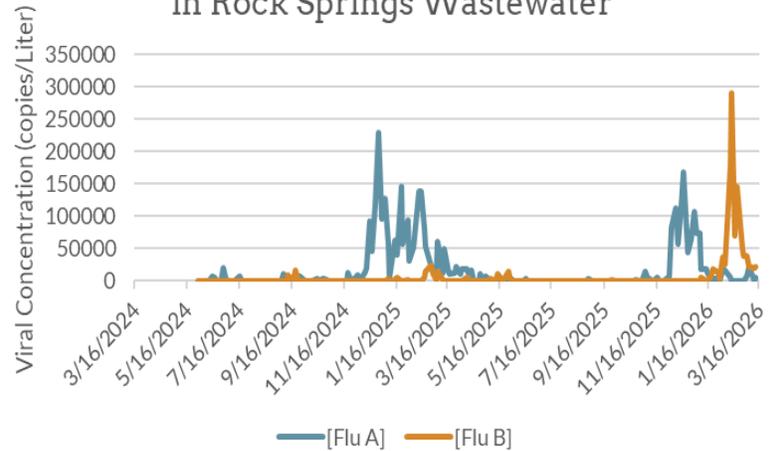

Our colleagues at the University of Wyoming (UW) have collaborated with the WPHL to analyze wastewater samples collected at four additional treatment facilities across the state. The graphs below show the current trend lines of varying influenza concentrations detected in wastewater, starting in June 2024 and continuing to the present. The current viral concentrations appear to be diminished compared to the higher values we observed last season during sustained community-wide transmission.

## UW Sites: Laramie, Rock Springs, Jackson, and Gillette

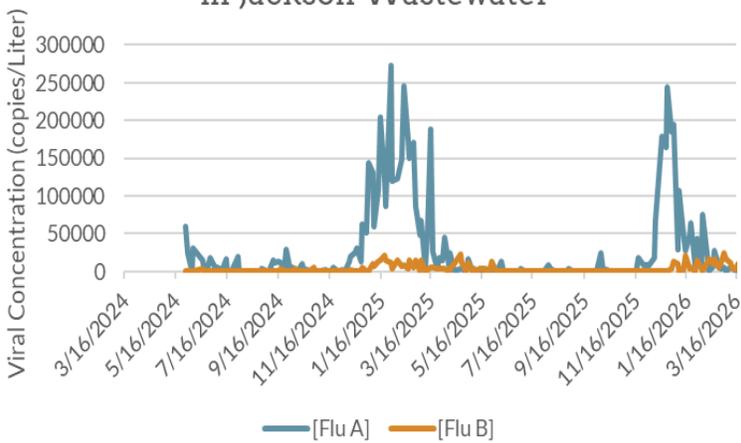

### Influenza A and B Concentration Levels in Laramie Wastewater

### Influenza A and B Concentration Levels in Rock Springs Wastewater

### Influenza A and B Concentration Levels in Jackson Wastewater

### Influenza A and B Concentration Levels in Gillette Wastewater
